## CSAC SA65

Chip-Scale Atomic Clock

#### **Features**

- Wide temperature range –40°C to +80°C
- Power consumption <120 mW</li>
- Less than 17 cc volume,
  1.6" × 1.39" × 0.45"
- 10 MHz CMOS-compatible output
- 1PPS output and 1PPS input for synchronization
- Comprehensive monitoring and control interface
- Short term stability (Allan Deviation) of  $3.0 \times 10^{-10}$  at  $\tau = 1$  sec

### **Applications**<sup>1</sup>

- GPS receivers
- Backpack radios
- · Anti-IED jamming systems
- · Autonomous sensor networks
- Unmanned vehicles
- Underwater sensor systems
- Stability for various other communication and transmission applications

With extremely low power consumption of <120 mW and a volume of <17 cc, the Microchip Chip Scale Atomic Clock (CSAC) brings the accuracy and stability of an atomic clock to portable applications.

The CSAC provides RF and 1PPS outputs at standard CMOS levels, with short-term stability (Allan Deviation) of  $3.0 \times 10^{-10}$  at  $\tau = 1$  sec, typical long-term aging of  $<9 \times 10^{-10}$ /month, and maximum frequency change of  $\pm 3 \times 10^{-10}$  over the operating temperature range of  $-40^{\circ}$ C to  $\pm 80^{\circ}$ C.

The CSAC accepts a 1PPS input that may be used to synchronize the unit's 1PPS output to an external reference clock with  $\pm 100$  ns accuracy. The CSAC is also able to discipline its phase and frequency to the external reference.

Comprehensive control, monitoring, and calibration of the SA65 is accomplished via a standard CMOS-level RS-232 serial interface built in to the SA65. The interface is also used to set and read the CSAC's internal time-of-day clock.

<sup>&</sup>lt;sup>1</sup>The CSAC is not tested, qualified, or rated for space applications.
